

In my language (Slovak), we have this accented character: ĺ (in TeX, that would be `\v{1}`, not `\'1`), which is a different letter - í )

- keyboard shortcut A-V l should produce ĺ, what it does is ~l instead
- when importing from TeX, the character imports as í, which is typographically wrong
- when importing from a (unicode) html, the character gets imported correctly as ĺ
